

System Compatible

Developing a filter that can effectively screen out Zebra Mussel “Veligers” solves only part of the problem. A filter that places too much demand on a system's pump, not only will cause a decrease in water volume and pressure but also can often lead to serious and expensive damage to the pump. To resolve this problem, **Primar Filtration** has worked closely with GOULDS Pumps, an industry leader with a nationwide reputation for manufacturing quality pumps. As a result of this team effort, extensive water flow tests on our filters have been conducted by GOULDS with the finding that each filter can easily accommodate a minimum flow rate of 80 gallons per minute and not be effected by strong system back-flushing.

Satisfied Customers

Since 1994, **Primar Filtration's** patented "**Shredder**" filter has been effectively protecting against Zebra Mussel infestation in homes and cottages throughout the Finger Lakes and Lake Champlain regions of the United States as well as in Ontario, Canada. To date, over a thousand filters have been purchased by a like number of very satisfied customers.

Long-Term Savings

The "**Shredder's**" unique replaceable filter cartridge design allows for uninterrupted and low-cost protection of your entire water system. Annual replacement of the filter cartridges ensures maximum efficiency while keeping maintenance costs to a bare minimum. In addition, because **Primar Filtration's "Shredder"** are installed at the offshore end of the water intake, Zebra Mussels are prevented from ever entering the water system. This totally eliminates the costly repairs and expensive cleaning often required once Zebra Mussels have attached themselves and colonized the household plumbing.
